

CRO Request / Brief Completion

CRO Brief: Test & Personalization Requests

The CRO team maintains a Jira board to track all internally- and client-facing work. For work to be recognized / accepted by other teams, work must be entered into the Jira board and flow through NM's project management process. The following is a guide for creating Jira tickets in support of flowing work through this process.

How to Request CRO Projects

1. Submit your personal copy to our [Jira request form](#)
 - a.
2. CRO will respond to your request with a go/no-go decision within 1 week. Decision criteria are:
 - a. Technical feasibility (is the project possible, from a technical perspective)
 - b. Audience feasibility (will the project be targeted to an audience with sufficient volume for the investment to yield positive return)
3. If the project is a Go, CRO will create a ticket in our CRO board's Ideation swim lane
 - a. We will add you as a watcher on this ticket, so you can see activity progression
 - b. For more info on the CRO workflow, go [here](#).
4. We will invite you to CRO breakout calls, for related stakeholder conversations (request grooming & relative prioritization)

NOTE: CRO requests take 3-4 months to fulfill, starting from the project's entry to our Jira board through to test completion.

We can't guarantee fulfillment any quicker than this timeframe, since relative prioritization of projects is client-led, and we must maintain steady fulfillment across several clients.

It's recommended that teams establish their own planning / road-mapping cadences, with this in mind.

Thoughts for filling out the request form

1. **What is being tested? Or what will be personalized?**

What is being changed? Detailed description of what is changing between the original page, and the new variation(s). Include before and after screenshots demonstrating change.

2. Why is this important?

Why do you think this new treatment will work, and if everything went perfectly, how much of an impact would it have to the bottom line of the client's business?

3. Which visitors do you want to see the test?

Is this test geared towards all visitors to a certain page, or a special subset, such as Desktop or Tablet, Geolocation, Current Customers or First Time Visitors, etc.

4. How will we measure success?

What would success look like? What would we see an increase or decrease in? What goal metric KPI would be positively driven by the work? If you need assistance here, submit a request to analytics.

5. What other pieces of data would you like to record?

Are there other metrics we can monitor, that may help explain or add depth to a change in our success metric? Are there any other success metrics that may be impacted negatively and should be monitored? (For example, we might get more users to sign up for a mailing list, but it could possibly decrease the number of people that directly contact a sales office).

6. Next Steps Once the Test Ends

It is a good idea to have a plan of action once the test ends. If you have a winning project, what comes next? Is there an opportunity to build on this result – e.g. are there any follow up tests, site changes, or operational changes that you have in mind? Please describe.
